Peck Reservoir Replacement Project

The Peck Reservoir Replacement Project is pleased to announce that it has reached a significant milestone! The project team is prepared to fill the new reservoir tank with fresh water, which will be a 24-hour per day process, for 10 consecutive days. Staff will be on site around the clock to monitor this activity and to ensure its completion. Other construction activities will continue to occur during normal work hours.

The fill process is not expected to impact neighboring community members. This activity is an important achievement towards the full completion of the reservoir and its facilities.

### Impacts

- Personnel on site during non-work hours (including weekends) to monitor tank fill process
- No major construction activities expected during non-work hours

### Background

The Peck Reservoir Facility, built in 1957, was identified as a top priority and recommended to be replaced as part of the 2010 Water System Master Plan. The new Peck Reservoir will increase its capacity to eight million gallons and include new state-of-the-art filtration and other equipment to serve the Manhattan Beach community for the next 75 years and help ensure the long-term dependability of the water system in the community.
